

431
A2

1. (Amended) A planar light emitting device comprising:
a transparent body having a transparent synthetic resin layer containing no light scattering material;
a semi-transparent body having a semi-transparent synthetic resin layer containing a light scattering material;
a diffusion layer, the transparent body and the semi-transparent body being joined to form the diffusion layer therebetween;
at least the transparent body, the semi-transparent body and the diffusion layer defining a planar light emitter; and
a light source disposed at least at one side of the planar light emitter;
wherein the diffusion layer includes a sea-islands structure, the sea-islands structure having a plurality of solid shapes.

Please add the following new claim 19:

A3

--19. (New) The planar light emitting device according to claim 1, wherein the planar light emitter comprises a flat shape--

See the attached Appendix for the changes made to the above claims
